

# Basic Operators in Bash

In Bash scripting, operators are used to perform operations on variables, strings, and files. There are several types of operators in Bash:

1. Arithmetic Operators
2. Relational Operators
3. Logical Operators
4. String Operators
5. File Test Operators

## 1. Arithmetic Operators

These operators are used to perform arithmetic operations like addition, subtraction, multiplication, and division.

Operator	Description	Example
<code>+</code>	Addition	<code>result=\$((a + b))</code>
<code>-</code>	Subtraction	<code>result=\$((a - b))</code>
<code>*</code>	Multiplication	<code>result=\$((a * b))</code>
<code>/</code>	Division	<code>result=\$((a / b))</code>
<code>%</code>	Modulo (remainder)	<code>result=\$((a % b))</code>
<code>++</code>	Increment (by 1)	<code>((a++))</code>
<code>--</code>	Decrement (by 1)	<code>((a--))</code>

### Example

```
#!/bin/bash
a=10
b=5
sum=$((a + b))
echo "Sum: $sum"
```

## 2. Relational Operators

These are used to compare two numbers.

Operator	Description	Example
<code>-eq</code>	Equal to	<code>[ \$a -eq \$b ]</code>
<code>-ne</code>	Not equal to	<code>[ \$a -ne \$b ]</code>
<code>-lt</code>	Less than	<code>[ \$a -lt \$b ]</code>
<code>-le</code>	Less than or equal to	<code>[ \$a -le \$b ]</code>
<code>-gt</code>	Greater than	<code>[ \$a -gt \$b ]</code>
<code>-ge</code>	Greater than or equal to	<code>[ \$a -ge \$b ]</code>

#### Example

```
#!/bin/bash
a=10
b=5
if [ $a -gt $b ]
then
    echo "$a is greater than $b"
fi
```

### 3. Logical Operators

Logical operators are used to combine multiple conditions.

Operator	Description	Example
<code>&amp;&amp;</code>	AND (both conditions must be true)	<code>if [ \$a -gt 5 ] &amp;&amp; [ \$b -lt 10 ]</code>
<code>!</code>	NOT (negates a condition)	<code>if ! [ -f "\$file" ]</code>

#### Example

```
#!/bin/bash
a=5
b=8
if [ $a -lt 10 ] && [ $b -gt 5 ]
then
    echo "Both conditions are true"
fi
```

The statement `if ! [ -f "$file" ]` is used to check if a file **does not exist** or is **not a regular file** in a Bash script.

#### Breakdown of the components:

`[ -f "$file" ]`:

1. This is a **file test** operator.
2. `-f` checks if the file specified by `$file` exists and is a **regular file** (not a directory, symbolic link, or other types of file).
3. If the file exists and is a regular file, the expression returns true (exit status 0).

### **! (Logical NOT):**

1. The `!` negates the result of the test.
2. If `[ -f "$file" ]` returns true, the `!` makes it false. If it returns false (meaning the file doesn't exist or isn't a regular file), the `!` makes it true.

### **How it works:**

- **True:** The if block will execute if the file **does not exist** or is **not a regular file**.
- **False:** If the file exists and is a regular file, the if block will be skipped.

### **Example:**

```
#!/bin/bash
file="/path/to/file.txt"

if ! [ -f "$file" ]; then
    echo "File does not exist or is not a regular file."
else
    echo "File exists and is a regular file."
fi
```

### **Explanation of the Example:**

- The script checks if `/path/to/file.txt` is a regular file.
- If it **does not exist** or is not a regular file (e.g., a directory, symbolic link, etc.), it will output: "File does not exist or is not a regular file."
- If it **exists** and is a regular file, it will output: "File exists and is a regular file."

## **4. String Operators**

String operators are used to perform operations on strings, like checking for equality, length, or pattern matching.

Operator	Description	Example
<code>=</code>	Equal to	<code>[ "\$a" = "\$b" ]</code>
<code>!=</code>	Not equal to	<code>[ "\$a" != "\$b" ]</code>
<code>-z</code>	String is empty	<code>[ -z "\$string" ]</code>
<code>-n</code>	String is not empty	<code>[ -n "\$string" ]</code>
<code>&gt;</code>	Greater than (lexicographically)	<code>if [[ "\$a" &gt; "\$b" ]]</code>
<code>&lt;</code>	Less than (lexicographically)	<code>if [[ "\$a" &lt; "\$b" ]]</code>

### Example

```
#!/bin/bash
a="hello"
b="world"
if [ "$a" != "$b" ]
then
    echo "Strings are different"
Fi
```

## 5. File Test Operators

These operators are used to check properties of files (e.g., if a file exists, if it's a directory, etc.).

Operator	Description	Example
<code>-e</code>	File exists	<code>[ -e "\$file" ]</code>
<code>-f</code>	File exists and is a regular file	<code>[ -f "\$file" ]</code>
<code>-d</code>	Directory exists	<code>[ -d "\$dir" ]</code>
<code>-r</code>	File is readable	<code>[ -r "\$file" ]</code>
<code>-w</code>	File is writable	<code>[ -w "\$file" ]</code>
<code>-x</code>	File is executable	<code>[ -x "\$file" ]</code>
<code>-s</code>	File is not empty (size > 0)	<code>[ -s "\$file" ]</code>
<code>-L</code>	File is a symbolic link	<code>[ -L "\$file" ]</code>

### Example

```
#!/bin/bash
file="/path/to/file.txt"
if [ -f "$file" ]
then
    echo "File exists and is a regular file."
else
    echo "File does not exist."
Fi
```

### Summary

Operator Type	Operator Example	Purpose
Arithmetic	<code>+</code> , <code>-</code> , <code>*</code> , <code>/</code> , <code>%</code>	Perform arithmetic operations
Relational	<code>-eq</code> , <code>-ne</code> , <code>-lt</code> , <code>-gt</code>	Compare numerical values
Logical	<code>&amp;&amp;</code> , <code>^</code>	
String	<code>=</code> , <code>!=</code> , <code>-z</code> , <code>-n</code> , <code>&lt;</code> , <code>&gt;</code>	Compare or test properties of strings
File Test	<code>-e</code> , <code>-f</code> , <code>-d</code> , <code>-r</code> , <code>-x</code>	Test file existence and properties
